Used Structural Steel

To date, projects where used structural steel was permitted have had the same pay item / default materials etc. as projects where new structural steel is required. This presents serious difficulties when creating sample records for the Contract, as the default requirements are for shop inspection verification from an approved listed fabricator.

When appropriate, add to the affected Contract line material sstl011 - Used Structural Steel. The test should be AM5006 - Type A Certification. The frequency etc. should be the same as was required by the default setup.

Please note in general remarks where the used steel came from (as best as you can). We have a feeling we will be asked for information regarding the use of crosstown used steel specifically.
